ORDO KEYBOARD SHORTCUTS

Ordo shortcuts

Shortcut	Action
Cmd + Left	Switch to previous workspace
Cmd + Right	Switch to next workspace
Alt + Tab	Focus most-recently-used window in the current workspace
Alt + Shift + Tab	Focus MRU window in the current workspace and monitor
Ctrl + Alt + Tab	Focus MRU window on the other monitor
Alt + Backtick (`)	Focus MRU window in the current workspace and app
Alt + Shift + Backtick	Focus MRU window in the current workspace, monitor and app
Ctrl + Alt + Backtick	Focus MRU window of the focused app on the other monitor
Alt + Down / Up (Alt still held from an MRU chord)	Walk further down the chord's MRU list / back up it (no wrap); release Alt to choose the window shown. The chord again chooses the window shown and starts over
Alt + Esc (Alt still held from an MRU chord)	Back to the window the walk started from, nothing chosen
Cmd + Shift + Left / Right	Move the focused window to the previous / next virtual monitor (focus and mouse go with it; a hidden monitor is viewed)
Cmd + Alt + Left / Right	View the previous / next virtual monitor: focus its MRU window and, where displays are short, show its windows in place of the current monitor's (no wrap)
Ctrl + Alt + Cmd + V	Virtualization on / off: off collapses every virtual monitor onto the displays present
Ctrl + Cmd + Left / Right	Carry the focused window to the previous / next workspace and switch there with it
Alt + End	Demote the focused window: back of the MRU history, back of the visual stack, focus moves to the next one
Ctrl + Alt + Cmd + Esc (twice within 2s)	Rescue / kill switch: disengage and gather windows back on-screen
Ctrl + Alt + Cmd + O	Engage WITH the state file: undo a rescue or bring a `--paused` run alive, loading the saved organization
Ctrl + Alt + Cmd + R	Engage WITHOUT the state file: blank workspace model; the file is neither read nor written until S or O
Ctrl + Alt + Cmd + S	Save state: turn the state file back on and persist the current arrangement as the new truth

When Ordo changes focus, the mouse pointer follows to the center of the newly focused window — for an MRU chord, once Alt is released. New windows open on the focused workspace and monitor.

Virtual monitors are positions, left to right, not displays: unplug the external display and its monitor's windows are hidden (or, with virtualization off, collapsed onto the laptop); plug it back in and they return to it. The viewed monitor is an anchor — it is always on screen, and Cmd+Alt+Left/Right move it
one step, so on a rig with a display per monitor they are focus jumps.

Standard macOS shortcuts (context and conflicts)

Shortcut	Action	Note
Ctrl + Left / Right	macOS native "switch Spaces"	Left to macOS; Ordo uses Cmd+arrows instead
Cmd + Tab	macOS app switcher	Unchanged by Ordo
Cmd + Backtick (`)	Cycle windows of the active app	Ordo uses Alt+Backtick to avoid clobbering this
Ctrl + Up	Mission Control	Unchanged
Ctrl + Down	App Expose (windows of the current app)	Unchanged

Deliberate conflicts

Cmd + Left / Right normally means start/end-of-line in text fields and Back/Forward in browsers, Cmd + Shift + Left / Right normally selects to line start/end, and Cmd + Alt + Left / Right switches tabs in browsers and editors. Ordo intercepts all three chord families globally, so those default behaviors are overridden while Ordo is active — an accepted tradeoff.
